CERTIFICATE

This is to certify that the Lab work entitled "Machine Learning (23CS6PCMAL)" carried out by **Sanghamitra R (1BM22CS237),** who is bonafide student of **B.M.S. College of Engineering.** It is in partial fulfilment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum. The Laboratory report has been approved as it satisfies the academic requirements in respect of an Machine Learning (23CS6PCMAL) work prescribed for the said degree.

① Initialising values directly into dataframe - five rows of data with col heading as USN, name, Marks

```
import pandas as pd
data = {"USN": ['234', '235', '236', '237', '238'],
        "Name": ["Asha", "Cathy", "Rosa", "Amy", "Gina"],
        "Marks": [85, 90, 78, 92, 88]
       }

df = pd.dataframe(data)
print(df)
```

1	235	Cathy	90
2	236	Rosa	78
3	237	Amy	92
4	238	Gina	88

② importing datasets from sklearn.datasets

```
from sklearn.datasets import load_diabetes
import pandas as pd
diabetes = load_diabetes
df_diabetes = pd.dataframe(diabetes.data, columns = diabetes.feature_names)
print(df_diabetes)

Q1. Which cols had missing values?

glucose level, blood pressure, insulin, gender, CLASS

for numeric data → mean
for categorical data → mode
→ (To handle missing values)

Q2 Which categorical col did you identify in dataset? How did you encode?

Gender and CLASS are the 2 categorical columns

Encoding method - Label encoding Male → 0
Female → 1

Q3. What is difference btwn minmax scaling and standardization?

Min-Max Scaling - transform data to fixed range [0,1]

$$X' = \frac{X - X_{min}}{X_{max} - X_{min}}$$

Standardisation - transform data so it has mean 0 and SD 1

$$X' = \frac{X - \mu}{}$$

1) Which variables did you identify as having a direct and clear impact? Why?

Satisfaction level - Correlation matrix, and bar plots show the negative relationship between satisfaction level and employee attrition

Time spent company - positive rel in correlation matrix more time spent in companies, equals to building a greater bond.

Salary - Salary is a primary motivator for employees.

2) What was the model accuracy? Good / bad?

approximate accuracy - 79.94%.
79.94% accuracy suggests that model is able to predict employee retention with a fair level of accuracy. This is good enough because aiming for 100% accuracy on real world data is not realistic.

16/04 Lab-7 Random Forest

Random forest is a ML algorithm that builds decision trees to make predictions.

Algorithm

1. Create multiple subsets of data using random sampling
2. At each node of decision tree, random forest of features is selected to split the data.
   if m features, select random forest of $\sqrt{m}$ features.
3. Grow multiple decision trees using bootstrapped datasets.
4. Combine the results of all individual trees

$$\hat{y} = \text{mode}(T_1(x), T_2(x), \dots T_N(x))$$
